PROJECT PRG1782 – THE FITFORGE WELLNESS CENTRE APP

Your cousin, Ava Stride, has recently launched a thriving business — a modern wellness centre offering fitness classes, a smoothie bar, and a mental wellness lounge, called *FitForge*. She's asked for your help to develop an application that determines the list of *ForgeFam* members (loyal customers) who have qualified for the monthly wellness reward credit.

PROJECT REQUIREMENTS

Proper planning is fundamental to ensure a streamline and well-designed application. To accomplish this, create a detailed **flowchart** demonstrating the logical flow of your console application. Using the flowchart as a guideline, create the final product which you will present to your cousin, or in this case, your lecturer. The requirements for the project can be seen below:

Each input record includes the applicant's:

- Name
- Age
- Membership rank (based on class attendance)
- Join date as a loyal member
- Number of smoothies purchased
- Personal best treadmill distance (in km)
- Current employment status
- Favourite smoothie flavour
- Number of smoothies consumed since joining

Functional Requirements:

- Create a method to capture the member's details and store them in a collection.
    - Ensure proper formatting for the data before storing.
    - The method should return the collection.
    - Allow unlimited entries until the user answers Y (Yes) or N (No) to "Do you want to enter another applicant?"
- Create a method to assess each applicant's eligibility for the wellness reward credit using the captured details.

  Members qualify if they:
    - Are employed (or their guardians are, if under 18)
    - Have been members for at least 2 years
    - Have a membership rank above 2000, *or* a treadmill record above 20 km or the combined average.
    - Have consumed an average of at least 4 smoothies per month

  Members do not qualify if:
    - They have consumed more than 20 smoothies per month (indicating an unhealthy addiction), *or* their favourite flavour is *"ChocoChurned Chaos"*

- Qualified members must be saved in a separate collection.
- Create a method that counts how many members qualified vs. how many were denied.
- Create a method that displays the wellness credit qualification statistics as described.
    - Provide stats on number of qualified, not qualified and total number of members – other stats can be displayed at your own discretion.
- Include an Enum menu with the following options:
    - Capture Member Details
    - Check Wellness Reward Qualification
    - Show FitForge Stats
    - Exit

Additional Notes:

- Remember to provide informative output to the user for all options mentioned.
- Ensure proper validation is done for user input.
- No classes may be used in your program.

Mark Allocation:

Section	Marks
Flowchart	20
Code Functionality	25
Coding Standards & Logic	15
Presentation & Understanding	15
Extra Effort (Bonus)	5
Total	**80**

IMPORTANT INFORMATION

- This is a group assignment. You will be grouped automatically into groups of 2-3 students.
- There will only be a single submission for each group on BC Connect.
- Belgium Campus makes use of software that can **scan for plagiarism, AI and paraphrasing**. Students caught doing this will get **0** for this assignment.
- Your lecturer may deduct marks if rules, instructions or guidelines are not adhered to as set per the project documentation.
- Late assignments will not be accepted, missing the deadline or not presenting your project is an automatic 0.
- Should you have any documentation, proper formatting is expected as informed during ACW.
